

COMPANY PROFILE

Radiator 2000 Spa

Radiator 2000 Spa, world leader in die cast aluminium radiators, is a group of brands able to bring to the market the widest range of hydronic and electric domestic heating systems.

Radiator 2000 Spa with its brands, is part of the Fecs industrial group (held by the entrepreneur Foglieni): a vertical and complete industrial system, true and unique example of perfect circular economy, able of following all the phases of the aluminium processing from the recovery of raw material from scraps to the upgrading and transformation in finished products ready to be installed.

Advanced technological know-how, made in Italy, very high quality guaranteed by strict controls throughout the supply chain, and environmental sustainability are the cardinal values of the work of the entire Radiatori 2000 Group.

ENVIRONMENTAL SUSTAINABILITY

From the recovery of 200 cans Radiatori 2000 is able to produce an heating radiator, in a short time, at low cost and, moreover, respecting the environment. Produce using recycled aluminium allows an energy savings of 95% compared to the use of the raw material directly extracted from the ground. Thus, the industrial Group of which Radiatori 2000 is part, recovers about 150,000 tonnes of raw materials per year, without injecting the equivalent of 300,000 tons of CO₂ into the atmosphere.

EFFICIENCY AND SAVINGS

The complete internal control of the entire production cycle of the raw material aluminium allows Radiatori 2000 to have a strong competitive edge on the market. Specialization, professional training and superior industrial know-how allow the production of strictly Made in Italy products with high performances, an excellent quality-price ratio and a quality guarantee for 10 years.

The use of the aluminium metal allows to obtain a high thermal yield with a lower quantity of water per element, allowing the radiators to heat up faster than those produced in other materials. The use of this metal is perfect in combination with modern low-temperature systems such as heat pumps, condensing boilers and solar panels resulting in significant energy savings, reduction in greenhouse gas emissions and a high reliability and durability of the heating system over time.

The Group exports about 85% of its production in over 50 countries in the world also thanks to its certifications both at company level as CE, ISO 9001, EN 14001 and OHSAS 18001 but also on a commercial and quality level like NF for France, AENOR for Spain, Gost for Russia and Ukraine.

VARIETY OF THE RANGE

The company, through its brands Radiatori 2000, Al-tech and Ridea Heating Design, offers collections of traditional die-cast aluminium radiators with clean lines, light extruded profiles at competitive prices or high-end design radiators characterized by a unique Italian flavour.

A wide range of solutions able to satisfy an increasingly attentive clientele.

All the radiators (die-cast and extruded) produced by the Group are available in the water version and in the respective electric one thanks to a special patented electrification technology of each heating body.

With the Liquid Stone electrification technology, oils or stones resistances are no longer used, but substituted with inert powders amalgamating with water and organic binders that allow to obtain unique benefits and savings for the electric products:

- Maximum comfort thanks to heat transmission by radiation
- Zero oil leaks
- Better heat uniform diffusion along the entire radiating surface
- Energy saving thanks to the intelligent chrono thermostat in line with the latest ERP 2018 EU Directive in terms of energy savings and control

A single partner by your side to heat up with efficiency and special attention to the environment.
